Report Overview

Cable operated screen is a mechanical equipment used in wastewater treatment systems to remove large debris, solids, and floating objects from the influent wastewater flow. The cable operated screen consists of a series of rake bars or tines connected by cables or chains. The screen is inclined at an angle to the flow direction, allowing the influent wastewater to pass through while trapping and lifting the debris using the rake bars and cables. The debris is then transported and discharged into a collection system for proper disposal. Cable rake screens are commonly used in wastewater treatment plants, pump stations, stormwater management systems, and other water treatment facilities. They effectively remove large solids, trash, vegetation, and debris to help prevent clogging, protect downstream equipment, and maintain the efficiency and reliability of the treatment processes. These screens can be automated and can be programmed to operate at specific intervals or based on the flow rate. They are an important part of the initial wastewater treatment process, ensuring the effective removal of large solids before further treatment or discharge.

The global Cable Operated Screen market size was estimated at USD 73.30 million in 2023 and is projected to reach USD 109.87 million by 2032, exhibiting a CAGR of 4.60% during the forecast period.
