## Abstracts

Cadmium bearing silver brazing alloys is a silver-based solder alloy containing a certain amount of cadmium, which is mainly used for brazing processes under high temperature environments. The addition of cadmium can improve the fluidity and wettability of the solder, thereby improving the quality and strength of the solder joint. At the same time, cadmium-bearing silver solder alloys also have good corrosion resistance and high-temperature oxidation resistance, and can maintain stable welding effects under harsh environments. However, due to the harmfulness of cadmium to the human body and the environment, the use of cadmium-bearing silver solder alloys has been strictly restricted and regulated. In modern industry, people prefer to use cadmium-free or low-cadmium environmentally friendly solder alloys.

The global Cadmium Bearing Silver Brazing Alloys market size was estimated at USD 865.1 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
