Abstracts

Calcia stabilized zirconia (CSZ) refers to a type of zirconia ceramic material in which calcium oxide (CaO) is used as a stabilizer to maintain the cubic crystal structure of zirconium dioxide (ZrO₂) at room temperature, preventing the undesirable phase transformations that can lead to cracking and structural failure. This stabilization enhances the material's thermal shock resistance, mechanical strength, and chemical inertness, making it particularly suitable for high-temperature applications such as refractory linings in furnaces, crucibles for metal melting, and thermal barrier coatings. Unlike its yttria-stabilized counterpart, which is often preferred in high-performance engineering applications like dental implants or oxygen sensors due to superior toughness, CSZ is valued in industries where cost-effectiveness and adequate thermal stability are prioritized over extreme mechanical properties.

The global Calcia Stabilized Zirconia market size was estimated at USD 347.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
