## Abstracts

Calcined anthracite refers to the anthracite which is calcined at high temperature, which retains its excellent grain stability and its good physical properties. Calcined anthracite is primarily used in the production of steel, as a carbon additive in blast furnaces, and in other metallurgical applications. The growth of the steel industry, driven by infrastructure development and urbanization, especially in emerging economies such as China, India, and Southeast Asia, is boosting the demand for calcined anthracite. Calcined anthracite is also widely used in the production of aluminum as a substitute for petroleum coke in the production of carbon anodes. As the aluminum industry grows due to increased demand from automotive, construction, and packaging sectors, the need for calcined anthracite is expected to rise.
