Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Calcium Carbonate Biocement competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Calcium carbonate biocement refers to a type of biocement that is produced through biological processes, primarily involving microorganisms like bacteria. This innovative construction material is created by inducing the precipitation of calcium carbonate (CaCO_3) from dissolved calcium and carbonate ions in the presence of these microorganisms. Biocement production can be more environmentally friendly compared to traditional cement production, which involves high-energy processes and emits significant amounts of carbon dioxide (CO_2). Biocement can potentially sequester carbon dioxide and promote the use of waste materials. Calcium carbonate biocement can be used for various construction applications, including soil stabilization, repair of concrete structures, and as a binding material in eco-friendly construction practices. Overall, calcium carbonate biocement represents a promising alternative to conventional cement, aligning with the growing demand for sustainable and eco-friendly construction materials.

The global Calcium Carbonate Biocement market size was estimated at USD 768.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
