Abstracts

Calcium indicators are fluorescent molecules that can respond to the binding of Ca^{2+} ions by changing their fluorescence properties. Ca^{2+} ions involve in various cell processes, and are easy to track. The development of advanced microscopy and imaging techniques, such as confocal microscopy, two-photon microscopy, and super-resolution microscopy, has increased the demand for calcium indicators with improved sensitivity and resolution. Fluorescent calcium indicators, which emit fluorescence signals upon binding to calcium ions, remain the most widely used type due to their versatility and compatibility with live cell imaging.
