Report Overview:

The electrolytic aluminum ingots with a content of 99.35% to 99.97% are first trimmed on a milling machine to remove defects such as burrs, oxidation spots and bubbles on the surface of the aluminum ingots, and process them into flat and smooth aluminum blocks. The processed aluminum block is then hot-rolled after heating or cold-rolled after annealing, and rolled into an aluminum sheet with a thickness of 3.175-0.584 mm. Then the aluminum sheet is annealed, after single-layer or double-layer (when the aluminum sheet is rolled to a thickness of about 0.038mm, you can put the two aluminum sheets into the rolling mill at the same time, and roll the two sheets together to form aluminum foil) multiple times. Rolled, rolled metal aluminum foil film is called calendered aluminum foil (metal aluminum foil or pure aluminum foil), which is commonly known as aluminum foil. The aluminum foil commonly used in flexible packaging has a thickness of 7-9 μm.

The Global Calendered Aluminum Foil Market Size was estimated at USD 2703.64 million in 2023 and is projected to reach USD 3989.66 million by 2029, exhibiting a CAGR of 6.70% during the forecast period.
