Abstracts

The calorimetric power meter is a high-precision power measurement instrument based on the principle of calorimetry. Its core function is to indirectly determine the input power by measuring the change in thermal energy caused by power absorption. The absorption load of the calorimetric power meter is usually a high thermal conductivity material (such as graphite, copper), which is used to completely absorb the input power and convert it into thermal energy. The temperature sensor is a thermocouple, thermistor or platinum resistor, which is used to monitor the load temperature change. The thermal insulation system is used to reduce environmental heat exchange and ensure the accuracy of temperature measurement.

The global Calorific Power Meter market size was estimated at USD 530.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
