Report Overview

A cam lobe motor is an electric motor whose motion is controlled by a cam mechanism. A cam is a special mechanical part whose profile moves along a profile trajectory and is used to control the movement of other parts. Cam lobe motors use the motion of a cam to drive the motor's rotor or other related components to achieve a specific motion pattern or function. This type of motor is often used in applications requiring complex or unconventional motion where traditional motor design or control methods may not be suitable. Cam lobe motors can achieve various motion modes by designing cam profiles of different shapes, such as simple reciprocating motion, complex curved motion, etc.
