Report Overview

The crude oil is filtered through a plate and frame filter to filter impurities such as sediment and cake residue, and then enters the production line through a crude oil pump, where the colloid and impurities in the crude oil are removed first, and then enters the decolorization pot, where the grease is absorbed by physical adsorption. The pigments, trace metals, suspended solids, etc. in the oil enter the deodorization pot through the gear pump to remove the plant odor contained in the tea seed oil. The tea seed oil contains a little wax, which will be present in the oil at low temperature. The flocs will also affect the taste of food. Therefore, it is necessary to remove the wax inside by winterization dewaxing. During the winterization dewaxing, the temperature is lowered little by little to make the wax inside crystallize. The filter machine filters out the wax, and finally obtains the crystal clear finished tea seed oil.
