Abstracts

A Camera Lens Extender, also known as an extension lens or a teleconverter, is an optical device that is installed between the camera lens and the camera body. Its main function is to increase the focal length of the lens, thereby magnifying the captured image, which is helpful for long-distance shooting, such as wildlife photography or sports event photography. Camera Lens Extenders usually have different magnifications such as 1.4x, 1.7x, 2x, etc. The choice of which magnification to use depends on the photographer's needs and the shooting scene. It should be noted that the use of an extension lens may cause a slight decrease in image quality, especially in low light environments or when shooting at the maximum aperture. In addition, the use of an extension lens will also affect the maximum aperture of the lens, which may require adjustment of exposure settings.

The global Camera Lens Extender market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
