## Abstracts

Camera tracking software, also known as matchmoving software, is a specialized digital tool used to analyze video footage and extract real-world camera motion data—including position, rotation, focal length, and lens distortion—so that computer-generated imagery (CGI), visual effects (VFX), or 3D elements can be seamlessly integrated into live-action plates with realistic perspective, scale, and movement. This technology is essential in film, television, advertising, and virtual production, enabling complex visual effects sequences by reverse-engineering the cinematographer's original camera path and replicating it within a 3D environment. Advanced solutions often incorporate AI and machine learning to improve tracking accuracy, handle challenging shots with motion blur or occlusions, and streamline workflows for VFX artists and animators.

The global Camera Tracking Software market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
