Abstracts

A camshaft adjuster is an engine technology used to control the relative position of the camshafts to optimize the opening and closing timing of the valves. It can adjust the phase of the camshaft in real time according to the requirements of the engine operating conditions, thereby changing the opening and closing time of the valve, optimizing the combustion process, and improving the engine's combustion efficiency, power output and fuel economy. The application of camshaft adjusters helps to reduce emissions, improve dynamic performance and achieve a better performance balance in different speed ranges. Future camshaft adjusters may be even more motorized, using electric drive systems for more precise adjustment and response. The intelligent control system may optimize the adjustment strategy and make optimal adjustments according to different working conditions.
