Abstracts

Cancer immunomodulators represent a class of therapeutics that modify the immune system's response to cancer, either by stimulating an immune attack against tumor cells or by suppressing mechanisms that tumors use to evade immune detection; these agents include checkpoint inhibitors (such as PD-1/PD-L1 and CTLA-4 blockers), cytokines, cancer vaccines, adoptive cell therapies (like CAR-T cells), and oncolytic viruses, all designed to harness or redirect the body's immune defenses to target malignancies with greater specificity and potentially fewer side effects than traditional chemotherapy.

The global Cancer Immunomodulator market size was estimated at USD 13850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
