Report Overview

The market for cancer mouse models encompasses genetically engineered, xenograft, and syngeneic mice used to study tumor biology, drug efficacy, and therapeutic mechanisms. These models replicate human cancer conditions by introducing mutations, grafting human tumor cells, or leveraging immunocompetent systems to mimic disease progression. Widely utilized in academic research, pharmaceutical development, and preclinical testing, they enable the evaluation of novel therapies, biomarkers, and personalized medicine approaches. The market is driven by increasing cancer research funding, advancements in genetic engineering (e.g., CRISPR), and the demand for precision oncology tools. Key segments include PDX (patient-derived xenograft) models, GEMMs (genetically engineered mouse models), and humanized mice, with applications spanning drug discovery, immunotherapy validation, and resistance mechanism studies. Challenges include high costs, ethical concerns, and limitations in fully replicating human tumor microenvironments, but innovation in model fidelity and scalability continues to propel growth.

The global Cancer Mouse Models market size was estimated at USD 1780.19 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
