Abstracts

Cancer pain is one of the most common symptoms in cancer patients. Pain can be caused by cancer, cancer treatment, or a combination of factors. The growth of the global cancer pain market is mainly due to the increasing prevalence of cancer; rising geriatric population; rising healthcare expenditure; and increasing investment in research and development activities by various healthcare companies. Due to aging effects and genetic mutations, older people are more prone to various types of cancer, such as lung cancer, bladder cancer, kidney cancer, melanoma, etc. According to the National Cancer Institute, the median age at diagnosis is 61 for breast cancer, 68 for colorectal cancer, 70 for lung cancer and 66 for prostate cancer. However, side effects associated with drugs used in cancer pain treatment, such as drug tolerance, drug dependence, urinary retention, sleep disturbance, cognitive impairment, etc., are expected to restrain the growth of the cancer pain market over the forecast period.

The global Cancer Pain market size was estimated at USD 6617.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
