## Abstracts

Cancer stem cell therapy represents an emerging class of treatments targeting cancer stem cells (CSCs), a subpopulation of tumor cells with self-renewal, differentiation, and tumor-initiating capabilities, which are believed to drive tumor progression, metastasis, and resistance to conventional therapies. These therapies aim to eradicate or inhibit CSCs through mechanisms such as signaling pathway inhibition, immunotherapy approaches, or nanotechnology-based delivery systems, with the goal of improving long-term remission and reducing relapse in various cancer types. The market encompasses both preclinical research and clinical-stage biopharmaceutical development, with a focus on identifying and validating CSC-specific biomarkers and therapeutic targets. Key players include biotechnology firms, academic research institutions, and pharmaceutical companies investing in novel agents like monoclonal antibodies, small molecule inhibitors, and CAR-T cell therapies designed to overcome treatment resistance. Growth is driven by increasing understanding of CSC biology, rising cancer incidence globally, and unmet needs in treating aggressive or recurrent cancers, though challenges such as tumor heterogeneity, drug delivery limitations, and high development costs remain significant barriers to widespread clinical adoption. Regulatory pathways are still evolving, with many therapies in early-phase trials, and market expansion will depend on demonstrating durable efficacy and safety in late-stage clinical studies.

The global Cancer Stem Cell Therapy market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
