Abstracts

Cancers immunotherapy drugs represent a class of biologic therapeutics designed to harness or enhance the body's own immune system to recognize, target, and destroy cancer cells, primarily through mechanisms such as immune checkpoint inhibition, adoptive cell transfer, monoclonal antibodies, cancer vaccines, and cytokine therapies. These treatments differ fundamentally from traditional chemotherapy and radiation by focusing on modulating immune responses rather than directly attacking tumors, offering the potential for durable remissions, reduced off-target toxicity, and applicability across a range of cancer types, both as standalone therapies and in combination regimens.
