Abstracts

Cannabis-based medicines are pharmaceutical products derived from the cannabis plant or synthetic cannabinoids, designed for therapeutic use to treat specific medical conditions such as chronic pain, epilepsy, multiple sclerosis-related spasticity, chemotherapy-induced nausea and vomiting, and certain psychiatric disorders; these medicines are standardized in composition, dosage, and delivery forms?such as oral solutions, capsules, sprays, or oils?and are subject to rigorous regulatory approval processes to ensure safety, efficacy, and quality control, distinguishing them from recreational or unregulated cannabis products. The global market for cannabis-based medicines has expanded significantly, driven by increasing legalization for medical use, growing clinical evidence supporting their efficacy, and rising patient demand for alternative treatment options, with key products including cannabidiol (CBD)-based medications like Epidiolex and nabiximols (Sativex), as well as dronabinol and nabilone; market growth is further fueled by investments in research and development, strategic partnerships between pharmaceutical companies and cannabis producers, and evolving regulatory frameworks that are gradually recognizing the medical value of cannabinoids, though challenges such as varying international regulations, stigma, high costs, and limited insurance coverage in some regions persist. North America and Europe currently dominate the market due to progressive legislation and established healthcare infrastructure, while emerging markets in Asia-Pacific and Latin America show potential for growth as regulatory barriers ease and awareness increases.

The global Cannabis Based Medicines market size was estimated at USD 2678.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
