### Report Overview:

Capillary electrophoresis system is an instrument used in separation of nucleic acids and proteins with high accuracy and within short span of time. Capillary electrophoresis is based on the principle of separation of molecules according to charge and size. The basic difference between capillary electrophoresis and gel electrophoresis is that the molecules are separated inside the small capillary tube which is filled with conductive buffer rather than gel. Separation of molecules using capillary electrophoresis is faster and gives higher resolution as the thin tubes have a higher surface-to-volume ratio, which enables to dissipate heat faster, and thus run at high voltages without overheating. Capillary electrophoresis requires small amount of sample which is advantageous in the analysis of rare and expensive sample.

The Global Capillary Electrophoresis Market Size was estimated at USD 341.56 million in 2023 and is projected to reach USD 439.72 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
