Abstracts

Captive power generation refers to the on-site production of electricity by industrial, commercial, or institutional entities primarily for their own consumption, rather than relying solely on grid-supplied power. These systems range from small diesel generators to large-scale natural gas turbines, biomass plants, or solar installations, and are typically employed to ensure uninterrupted operations, reduce energy costs, mitigate grid instability, or utilize waste heat through cogeneration. Unlike utility-scale power plants, captive generation facilities are not designed for selling electricity to the wider market but serve as a dedicated energy source for the owner's facilities, offering greater control over supply reliability, quality, and tariff fluctuations.

The global Captive Power Generation market size was estimated at USD 48352.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
