Abstracts

A car clutch pilot bearing, also known as a spigot bearing or input shaft bearing, is a small but critical component within a vehicle's manual transmission system that supports the input shaft of the transmission and centers it within the crankshaft of the engine. This bearing enables smooth rotation and reduces friction between these two components during clutch engagement and disengagement, ensuring proper alignment and preventing undue wear or damage to the transmission assembly. Typically constructed from durable materials such as bronze, needle roller bearings, or ball bearings, it is designed to withstand high rotational speeds and mechanical stress, though it is often subject to failure due to heat, contamination, or lack of lubrication, necessitating replacement during clutch system repairs.

The global Car Clutch Pilot Bearing market size was estimated at USD 185.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
