Abstracts

An automotive emergency braking system (AEBS), also known as automatic emergency braking (AEB), is an active safety technology designed to prevent or mitigate collisions by automatically applying the brakes when a potential frontal impact is detected and the driver has not taken sufficient action. These systems utilize a combination of sensors?such as radar, cameras, and lidar?to continuously monitor the road ahead for obstacles, including vehicles, pedestrians, and cyclists. When an imminent collision is identified, the system first issues a warning to the driver and, if no evasive action is taken, autonomously initiates partial or full braking to reduce impact speed or avoid the crash entirely. This technology is increasingly integrated with other advanced driver-assistance systems (ADAS) and represents a critical component in the progression toward semi-autonomous and fully autonomous driving.

The global Car Emergency Braking System market size was estimated at USD 6075.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
