Report Overview

The Car Seat Heating-Ventilation-Lumbar system is a sophisticated feature designed to enhance comfort and adjustability for vehicle occupants. Here's an overview of each component: The car seat heater is a device installed inside the seat and composed of components such as resistance wire to heat the seat. It can quickly heat the seat in a short time. Seat ventilation is to install a ventilation fan inside the seat to achieve the ventilation function. According to different air supply methods, seat ventilation is divided into two methods: blowing outward and sucking inward. The biggest advantage of the outward blowing method is that the wind pressure is large and the heat dissipation effect is fast, but the disadvantage is that the airflow is unstable and turbulence will occur, which is what call turbulence, caused by the unstable wind flow direction. Although the wind pressure of the inward suction method is smaller, the wind direction is very stable, and the ride is more comfortable. The structure of the lumbar support system of automobile seats includes air bags, the air pressure of which is provided by the air pump in the engine compartment, and the air pressure chamber of the air bag is controlled by an electronic oscillator arranged in the backrest.
