Abstracts

Carb blocker supplements are dietary products formulated to inhibit enzymes responsible for carbohydrate digestion, primarily targeting alpha-amylase and alpha-glucosidase, thereby reducing the absorption of starches and sugars from consumed foods. These supplements typically contain natural ingredients such as white kidney bean extract, phaseolamin, or other plant-derived compounds that interfere with the breakdown of complex carbohydrates into simple sugars, leading to fewer calories being absorbed and potentially aiding in weight management, blood sugar control, or low-carb dietary adherence. Marketed to health-conscious consumers, athletes, and individuals managing diabetes or obesity, these products are available in various forms including capsules, tablets, and powders, and are positioned as tools to mitigate the impact of high-carb meals without requiring strict dietary elimination.

The global Carb Blocker Supplements market size was estimated at USD 420.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
