Abstracts

The basic structure of carboline alkaloids is composed of a pyridine ring and an indole ring fused in different ways, with a unique three-ring structure. According to the different connection positions and methods of the pyridine ring and the indole ring, they can be divided into many types, the most common of which are β -carboline and α -carboline. For example, β -carboline is formed by connecting the 3-position of the indole ring to the 2-position of the pyridine ring; α -carboline is formed by connecting the 2-position of the indole ring to the 3-position of the pyridine ring. This special structure gives carboline alkaloids rich chemical properties and biological activities.

The global Carboline Alkaloids market size was estimated at USD 278.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
