Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Carbon-based Organic Solar Cell competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A carbon-based organic solar cell is a type of photovoltaic device that uses organic (carbon-containing) semiconducting materials—typically polymers or small organic molecules—to convert sunlight into electricity. Unlike traditional silicon-based solar cells, these cells rely on the photoactive properties of organic compounds, such as conjugated polymers or fullerene derivatives, to absorb light and generate charge carriers. The structure usually consists of multiple thin layers, including a transparent electrode, an active layer (where light absorption and charge separation occur), and a counter electrode. Due to the flexibility, lightweight nature, and potential for low-cost roll-to-roll manufacturing, carbon-based organic solar cells are particularly attractive for use in portable electronics, building-integrated photovoltaics (BIPV), and low-light indoor energy harvesting. However, challenges such as lower power conversion efficiency and limited long-term stability compared to inorganic counterparts remain key areas of ongoing research.

The global Carbon-based Organic Solar Cell market size was estimated at USD 284.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
