Abstracts

Screen-printed electrodes (SPEs) are a type of sensing platform widely used in electrochemical applications. These electrodes are created through a cost-effective and scalable screen-printing process, where conductive ink is deposited onto a substrate through a mesh screen. The resulting electrodes are characterized by their simplicity, versatility, and reproducibility. SPEs find applications in various fields, including biochemistry, environmental monitoring, and sensor development. The carbon-based screen-printed electrodes (SPEs) includes electrodes predominantly composed of carbon materials such as graphite, carbon nanotubes, or graphene. These materials offer excellent electrical conductivity, chemical stability, and biocompatibility. The manufacturing process allows for the customization of electrode designs, enabling the integration of different materials and configurations to meet specific application requirements. The simplicity of production makes SPEs an attractive choice for mass production and disposable sensor applications. Due to their miniaturized and portable nature, screen-printed electrodes have become integral components in point-of-care diagnostic devices and wearable sensors, facilitating rapid and on-site analysis. The versatility and accessibility of SPEs contribute to their growing popularity in research and industry, making them essential tools for electrochemical measurements in diverse fields.
