Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Carbon Black Composite Conductive Paste competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of carbon black composite conductive paste will reach 17k tons, with an average selling price of US\$25k per ton. Carbon black composite conductive pastes are a type of functional conductive material composed primarily of conductive carbon black as the primary conductive filler, combined with auxiliary materials such as polymer resins, solvents, and dispersants. The high surface area and conductive network structure of the carbon black particles create a continuous conductive path within the matrix, thereby imparting excellent conductivity and stability to the coating or film. Compared to pure carbon black conductive pastes, composite pastes often incorporate materials such as silver powder, graphene, and carbon nanotubes to enhance conductivity, reduce volume resistivity, and maintain flexibility, adhesion, and weather resistance.

The global Carbon Black Composite Conductive Paste market size was estimated at USD 421.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
