Abstracts

Carbon black feedstock refers to the primary raw material used in the production of carbon black, a fine powder consisting of elemental carbon that is widely utilized as a reinforcing filler in rubber products such as tires and industrial goods, as well as a pigment in plastics, inks, and coatings. The primary sources of carbon black feedstock are heavy petroleum products, including residual oils from crude oil refining, coal tar, and ethylene cracking tar obtained as a byproduct from olefin manufacturing. These feedstocks are selected based on their chemical composition, particularly high aromatic hydrocarbon content and low sulfur and ash levels, to ensure the quality, yield, and performance characteristics of the resulting carbon black. The availability, pricing, and environmental regulations surrounding these feedstocks are critical factors influencing the carbon black market, as shifts in refinery outputs, petrochemical industry dynamics, and sustainability initiatives?such as the development of bio-based or recycled feedstocks?directly impact supply chains and production economics.

The global Carbon Black Feed Stock market size was estimated at USD 19200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
