## Abstracts

Carbon Capture Mineralization is a process that captures carbon dioxide (CO<sub>2</sub>) from industrial emissions or the atmosphere and converts it into stable mineral carbonates through a chemical reaction with naturally occurring or engineered materials, such as calcium- or magnesium-rich rocks and industrial byproducts. This method provides a permanent and safe way to store CO<sub>2</sub> while also producing useful materials for construction, soil enhancement, and other applications. Unlike traditional carbon capture and storage (CCS), mineralization locks CO<sub>2</sub> in solid form, reducing the risk of leakage and contributing to long-term climate mitigation.

The global Carbon Capture Mineralization market size was estimated at USD 388.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.10% during the forecast period.
