Abstracts

Carbon Capture and Utilization (CCU) is considered the end-stage application of carbon capture technologies. As the final step in carbon capture processes, CCU utilizes CO₂ which captured from Pre-Combustion Carbon Capture, Oxy-Combustion Carbon Capture, Post-Combustion Carbon Capture, and apply it in Oil & Gas, Power Generation, etc. In the energy sector, CO₂ is used for Enhanced Oil Recovery (EOR) to increase oil extraction efficiency. In chemicals and fuels, captured CO₂ serves as a feedstock for synthetic fuels, methanol, and other industrial chemicals. The construction industry utilizes CO₂ in concrete curing and carbonated building materials, enhancing strength while reducing emissions. Such technologies are at different stages of development, and some are already commercially available. CCS (Carbon Capture and Storage) is a technology designed to reduce carbon dioxide (CO₂) emissions by capturing CO₂ from industrial processes and power plants and piping it to a storage site to be permanently sequestered, thereby preventing it from entering the atmosphere. Whether it is CCS or CCU, the captured CO₂ needs to be compressed for transportation and subsequent processing, so CCS, CCU together form CCUS, an integrated technology that reduces greenhouse gas emissions and mitigates the impacts of climate change by capturing carbon dioxide (CO₂) generated from industrial and energy production processes and utilizing it or sequestering it. The CCUS technology is not only capable of capture and store CO₂ but also be able to convert it into valuable products, thus realizing both environmental and economic benefits. These applications not only mitigate emissions but also create economic value, driving the commercialization of CCU technologies.
