## Abstracts

Carbon Capture and Utilisation (CCU) is a diverse set of technologies that allow for the capture and use of carbon as a feedstock for making essential products such as fuels, chemicals and building materials that today are predominantly derived from fossil resources. Such technologies are at different stages of development and some are already commercially available. CCS (Carbon Capture and Storage) is a technology designed to reduce carbon dioxide (CO<sub>2</sub>) emissions by capturing CO<sub>2</sub> from industrial processes and power plants and piping it to a storage site to be permanently sequestered, thereby preventing it from entering the atmosphere. Whether it is CCS or CCU, the captured CO<sub>2</sub> needs to be compressed for transportation and subsequent processing, so CCS, CCU together form CCUS, an integrated technology that reduces greenhouse gas emissions and mitigates the impacts of climate change by capturing carbon dioxide (CO<sub>2</sub>) generated from industrial and energy production processes and utilizing it or sequestering it. The CCUS technology is not only capable of capture and store CO<sub>2</sub>, but also be able to convert it into valuable products, thus realizing both environmental and economic benefits. Since Carbon Capture and Utilization (CCU) is a relatively new technology with relatively high entry barriers and low degree of commercialization, the research topic of this article - Carbon Capture and Utilization System (CCU), takes CCUS as the complete value The basis of the chain, that is, covering related services and equipment, etc., to carry out subsequent statistical research.
