Abstracts

A carbon composite threaded rod is a threaded rod primarily made from carbon fiber or carbon fiber-reinforced composite materials. Carbon fiber is a high-strength, high-modulus fiber with a carbon content exceeding 90%. It is combined with a resin matrix (such as epoxy resin) through specific composite processes (like winding and pultrusion) to form a composite material with excellent mechanical properties. After molding and processing, it is shaped into a rod structure with continuous spiral grooves (threads), resembling traditional metal threaded rods but possessing the unique properties of carbon composites. This type of threaded rod can be used for connecting, fastening, and transmitting force, and it offers advantages in applications where special requirements are placed on weight, strength, corrosion resistance, and other properties.

The global Carbon Composite (CFC) Threaded Rods market size was estimated at USD 473.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
