Abstracts

Carbon conductive grease is a specialized thermal interface material (TIM) that combines the thermal conductivity properties of traditional thermal greases with electrical conductivity, primarily achieved through the incorporation of carbon-based fillers such as graphite, carbon nanotubes, or graphene. Unlike standard thermal pastes, which are electrically insulating, this formulation allows for the simultaneous dissipation of heat and transmission of electrical current, making it particularly suitable for applications where electrical grounding, electromagnetic interference (EMI) shielding, or static dissipation is required alongside thermal management. It is commonly used in electronics, power devices, automotive systems, and aerospace components where efficient heat transfer and electrical connectivity must coexist without risk of short-circuiting sensitive components. The product bridges a niche segment between purely thermal and purely conductive compounds, offering a balanced solution for advanced engineering needs.

The global Carbon Conductive Grease market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
