## Abstracts

Carbon dioxide capture and storage (CCS) (or carbon capture and sequestration or carbon control and sequestration) is the process of capturing waste carbon dioxide (CO<sub>2</sub>) from large point sources, such as fossil fuel power plants, transporting it to a storage site, and depositing it where it will not enter the atmosphere, normally an underground geological formation. The aim is to prevent the release of large quantities of CO<sub>2</sub> into the atmosphere (from fossil fuel use in power generation and other industries). It is a potential means of mitigating the contribution of fossil fuel emissions to global warming and ocean acidification. Although CO<sub>2</sub> has been injected into geological formations for several decades for various purposes, including enhanced oil recovery, the long term storage of CO<sub>2</sub> is a relatively new concept. The main Carbon Capture and Storage players include Exxonmobil Corporation, Schlumberger, Linde AG, Halliburton, etc. The top four Carbon Capture and Storage players account for approximately 35% of the total global market. America is the largest consumer market for Carbon Capture and Storage accounting for about 49%, followed by Asia Pacific and Europe. In terms of Type, S Post-Combustion Carbon Capture is the largest segment with a share of 83%. And in terms of Applications, the largest segment is Oil & Gas, followed by Power Generation.

The global Carbon Dioxide Capture and Storage market size was estimated at USD 4422.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
