Abstracts

The carbon dioxide membrane contactor is based on membrane separation technology. It combines membrane separation with gas absorption through hollow fiber membrane or microporous membrane to achieve selective separation of carbon dioxide. During the separation process, the gas mixture containing carbon dioxide passes through one side of the membrane, while the absorption liquid passes through the other side of the membrane. The carbon dioxide molecules diffuse in the membrane pores and contact with the absorption liquid, undergoing a chemical reaction and being removed.

The global Carbon Dioxide Membrane Contactor market size was estimated at USD 254.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
