Report Overview

Carbon Emission Continuous Monitoring System is a fixed or regional emission source monitoring system developed based on the current situation of carbon emission monitoring. It can continuously monitor the concentration and total emission of gaseous pollutants or particulate matter emitted by air pollution sources online, and monitor the front-end monitoring sites. The data is statistically analyzed to complete carbon emission monitoring, verification and early warning, to achieve accurate monitoring of carbon emissions from key pollutant-emitting enterprises and key pollution sources, and to provide strong technical support for digital, intelligent, and online monitoring of carbon emissions. Compared with the carbon emission data of material accounting, the system uses real-time monitoring data to establish a carbon emission accounting method system based on monitoring data, which can further improve the accuracy and real-time nature of carbon emission accounting data.

The global Carbon Emission Continuous Monitoring System market size was estimated at USD 625.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
