Abstracts

Carbon fiber fully wound composite gas cylinder is a container used for storing compressed gas, which is made of carbon fiber reinforced composite material. This type of gas cylinder has the following characteristics: 1 Carbon fiber reinforcement: Carbon fiber is a high-strength, low-density material with excellent mechanical properties. In carbon fiber fully wound composite gas cylinders, carbon fiber is used as a reinforcing material to give the cylinder high strength and stiffness. 2. Full winding structure: The carbon fiber fully winding composite gas cylinder adopts a full winding structure, which means that the carbon fiber cloth is continuously wound on the surface of the gas cylinder at a specific angle, forming layers of fiber reinforcement. This structure can provide uniform mechanical properties and high durability. 3. Lightweight: Due to the low density of carbon fiber, carbon fiber fully wound composite gas cylinders have a lighter weight compared to traditional metal gas cylinders. This makes the gas cylinder more portable and easy to carry. 4. High pressure storage: Carbon fiber fully wound composite gas cylinders can withstand high pressures, with common working pressures ranging from 300 to 700 bars. This makes them suitable for storing high-pressure gases such as hydrogen, natural gas, oxygen, etc. Carbon fiber fully wound composite gas cylinders are widely used in aerospace, automotive, industrial, and civilian fields for storing and transporting various gases. They have high safety, corrosion resistance, and wear resistance, as well as good airtightness and burst resistance.

The global Carbon Fiber Fully Wound Composite Gas Cylinder market size was estimated at USD 1250.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
