Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Carbon Fiber Reinforced PA66 competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Carbon Fiber Reinforced PA66 (PA66-CF) is a high-performance composite engineering plastic. By adding carbon fibers to the nylon 66 (PA66) matrix, the overall performance of the material is significantly improved. This material combines the chemical resistance and abrasion resistance of nylon 66 with the extremely high strength, stiffness, and lightweight properties of carbon fiber. This composite material, made by blending nylon 66 resin with specially surface-treated carbon fibers, offers superior strength, stiffness, dimensional stability, high-temperature resistance, and abrasion resistance, making it a viable alternative to metals for demanding environments requiring high performance. Global sales in 2024 were approximately 300,000 tons, with an average market price of approximately US\$2,700 per ton. The size of a single production line varies depending on the manufacturing process and investment scale. Industry gross profit margins range from 15% to 30%. However, the unit price of carbon fiber itself is much higher than that of glass fiber, and the material cost of CFRTP is generally significantly higher than that of traditional engineering plastics such as glass fiber reinforced PA and PBT. The production process of carbon fiber reinforced nylon places higher demands on equipment rigidity, mold steel, and process control than that of ordinary nylon and GF systems. Driven by the "dual carbon" goals, the new energy vehicle industry has an urgent need for lightweight materials. Carbon fiber reinforced nylon 66, with its high strength and low density, can effectively improve vehicle range and is used in battery boxes, chassis components, and other applications. Meanwhile, the advancement of projects in the aerospace field and the development of industries such as electronics and electrical engineering have

opened up vast opportunities for high-performance composite materials. However, the unit price of carbon fiber itself is much higher than that of glass fiber, and the material cost of CFRTP is generally significantly higher than that of traditional engineering plastics such as glass fiber reinforced PA and PBT. The production process of carbon fiber reinforced nylon places higher demands on equipment rigidity, mold steel, and process control than that of ordinary nylon and GF systems.

The global Carbon Fiber Reinforced PA66 market size was estimated at USD 810.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
