Abstracts

Carbon fiber threads are thin strands or filaments consisting mostly of carbon atoms that are extremely strong, lightweight, and have a high tensile strength. A precursor substance such as polyacrylonitrile (PAN), pitch, or rayon is selected as part of the production of carbon fiber threads. If PAN is used, it goes through a polymerization process, and PAN fibers are generated by spinning a PAN solution or melting into filaments. After that, the precursor fibers are stabilized by being subjected to an appropriate temperature in an atmosphere free of oxygen. After stabilization, the fibers undergo carbonization, where they are heated to temperatures beyond 1000°C in a controlled environment with little oxygen. By removing non-carbon components and converting the fibers into carbon-rich material, this technique produces carbon fiber threads with excellent strength and light in weight.

The global Carbon Fiber Thread market size was estimated at USD 1827.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
