Abstracts

Carbon fibre reinforced carbon (CFRC), carbon?carbon (C/C), or reinforced carbon?carbon (RCC) is a composite material consisting of carbon fiber reinforcement in a matrix of graphite. Carbon?carbon is well-suited to structural applications at high temperatures, or where thermal shock resistance and/or a low coefficient of thermal expansion is needed. Carbon Fiber Reinforced Carbon (CFRC), as an advanced composite material, holds promising development prospects within the current industrial landscape. In the upstream sector, advancements in carbon fiber manufacturing technology, along with stable raw material supply and ongoing process improvements, have contributed to the enhancement of CFRC's quality and performance. Simultaneously, downstream markets are witnessing a growing demand for lightweight, high-strength materials, particularly in aerospace, automotive engineering, and energy sectors. Moreover, the increasing emphasis on environmental sustainability is driving the application of CFRC as a viable alternative material. However, it is important to note that the high cost and intricate manufacturing processes of CFRC still present challenges in its widespread adoption. Therefore, as technology continues to advance, collaborative efforts and optimizations along the industry value chain will aid in cost reduction, efficiency improvement, and the broader application of CFRC across various domains.

The global Carbon Fibre Reinforced Carbon (CFRC) market size was estimated at USD 373.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
