Abstracts

The Carbon Footprint Monitoring Platform is a smart device or system used to track and assess the greenhouse gas emissions (measured in carbon dioxide equivalents) produced by individuals, organizations, or products over a specific period. It typically connects to power systems, production lines, logistics management systems, or IoT sensors to monitor carbon source activities such as energy consumption, transportation, and raw material usage in real-time. Through algorithmic calculations, this data is converted into carbon emission figures. Some advanced devices also support carbon quota management, emission forecasting, and carbon neutrality recommendations to assist enterprises in compliance and ESG goal management.
