Abstracts

Carbon friction materials are specialized composites engineered to provide controlled frictional resistance and high thermal stability, primarily composed of carbon fibers, graphite, and other carbonaceous substances reinforced with resins or metallic binders. These materials are designed to operate under extreme conditions, such as high temperatures, heavy loads, and aggressive environments, where traditional organic or semi-metallic friction materials would degrade or fail. Key characteristics include consistent friction performance, low wear rates, resistance to thermal fade, and the ability to function with minimal lubrication or in dry applications. They are widely utilized in high-performance braking systems, clutches, and industrial machinery where reliability, durability, and precise friction modulation are critical.

The global Carbon Friction Materials market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
