Abstracts

Carbon nanotube gas sensors are a class of advanced sensing devices that utilize the unique electrical and chemical properties of carbon nanotubes (CNTs) to detect and quantify specific gases in various environments. These sensors operate on the principle that gas molecules adsorb onto the surface of the CNTs, altering their electrical conductivity in a measurable and often reversible manner. Due to their high surface-to-volume ratio, exceptional sensitivity at room temperature, and potential for miniaturization, carbon nanotube gas sensors are particularly valued for applications requiring rapid, low-power, and highly selective detection of gases such as nitrogen dioxide, ammonia, carbon monoxide, and volatile organic compounds.

The global Carbon Nanotube Gas Sensors market size was estimated at USD 243.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 9.85% during the forecast period.
