Abstracts

Carbon nanotube high thermal conductivity sheet is a material with excellent thermal conductivity, which is composed of carbon nanotubes. Carbon nanotubes are tubular structures formed by curling carbon atoms in a two-dimensional form, with high crystallinity and nanoscale size. Carbon nanotube high thermal conductivity sheets have the following characteristics and advantages: high thermal conductivity: Carbon nanotubes have extremely high thermal conductivity, far surpassing many traditional materials, such as copper and aluminum. This makes carbon nanotube high thermal conductivity fins widely used in the fields of heat dissipation and thermal management, effectively transferring and dissipating heat from heat sources, and improving the thermal management efficiency of equipment. Low density: Carbon nanotubes are very lightweight materials with low density and high specific surface area. Therefore, carbon nanotube high thermal conductivity sheets can provide high thermal conductivity while reducing the weight burden of materials, making them very suitable for lightweight design and high-performance equipment requirements. Mechanical strength: Although carbon nanotubes are nanoscale materials, they have excellent mechanical strength and stiffness. Carbon nanotube high thermal conductivity sheets can maintain their structural integrity and thermal conductivity under high temperature and high pressure environments, and have good durability. Customizability: Carbon nanotube high thermal conductivity sheets can customize their thermal conductivity by adjusting the structure, concentration, and arrangement of carbon nanotubes. This allows for the design and preparation of high thermal conductivity sheets suitable for different application scenarios according to specific needs. Carbon nanotubes (CNTs) with high thermal conductivity are widely used in electronic devices, Thermal interface material, heat pipes, radiators, laser cooling and other fields. They can significantly improve the heat dissipation efficiency of equipment, reduce temperature, and improve performance and

reliability.

The global Carbon Nanotube High Thermal Conductivity Sheet market size was estimated at USD 342.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
