Abstracts

Carbon-negative cement refers to types of cement that, throughout their lifecycle, absorb more carbon dioxide (CO₂) than they emit. This is in contrast to traditional cement and concrete production, which is responsible for a significant portion of global CO₂ emissions, primarily due to the calcination process of limestone and the energy-intensive methods used in cement production.

The global Carbon-negative Cement market size was estimated at USD 872.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
