Abstracts

Carbon recycle concrete represents an innovative construction material produced by incorporating captured carbon dioxide (CO₂) into concrete manufacturing processes, typically through carbonation curing or integration of carbonated aggregates, where CO₂ is chemically mineralized and permanently stored within the concrete matrix. This approach not only reduces the carbon footprint of concrete—one of the world's most carbon-intensive materials—but also enhances material properties such as compressive strength and durability, offering a dual benefit of emissions reduction and performance improvement.

The global Carbon Recycle Concrete market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
