Report Overview

A Sea-Doo carbon ring (known as a carbon seal as well) is a part of a seal that is designed to keep the water outside the hull. This small ring with the rubber boot and the metal support ring all encase the driveshaft to give it a waterproof seal. As the carbon ring can wear out, it needs to be periodically replaced. Carbon ring seal is a sealing element used to seal between a rotating shaft and a stationary component. It is made of carbon fiber material and has excellent wear resistance, corrosion resistance, and high-temperature resistance. Carbon ring seals are commonly used in high-speed rotating equipment, such as centrifugal pumps, compressors, agitators, etc. Its main function is to prevent liquid or gas leakage and maintain the normal operation of the equipment. The working principle of carbon ring sealing is achieved through the friction and pressure between the carbon ring and the rotating shaft. When the rotating shaft rotates, the carbon ring will generate friction with the shaft, forming a sealing interface to prevent the leakage of liquid or gas. At the same time, the carbon ring has a certain degree of elasticity and can adapt to small deviations and vibrations of the shaft, maintaining a sealing effect.
