Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Carbon Steel Substrate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Carbon Steel Substrate is a base material made of iron and carbon (0.05–2% content) that serves as the foundation for further processing, coating, or fabrication. It is produced through blast furnace–basic oxygen furnace (BF–BOF) or electric arc furnace (EAF) routes, then processed by hot or cold rolling, annealing, and surface finishing. In the supply chain, upstream inputs include iron ore, coking coal, and alloying elements; midstream steps involve steelmaking and substrate preparation; and downstream use covers coated steels (galvanized, painted, or plated), automotive body panels, construction beams, pipelines, industrial machinery, and consumer appliances. Globally, output is ~62 million tons annually, with installed capacity of ~78 million tons, indicating strong utilization. Prices range from USD 680–1,050 per ton depending on grade, thickness, and form, while producers typically operate at modest profitability with average gross margins around 18%.

The global Carbon Steel Substrate market size was estimated at USD 52836.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
